

AMENDMENTS TO THE CLAIMS

The following listing of claims will replace all prior versions and listings of claims in the application.

LISTING OF CLAIMS

1. (currently amended) A dynamic seal assembly for installation between first and second relatively rotating members, said assembly comprising:

a ring for fixed engagement with said first member and an annular seal extending radially from said ring and configured to slidably engage said second member, said radial seal having a tangent-delta of less than about 1.0 and comprising a non-continuous phase vulcanized fluorocarbon elastomer dispersed in a continuous phase thermoplastic material matrix comprising a ~~thermoplastic material~~ non-fluorine containing polymeric material,

wherein said radial seal has a thickness, and a length that is from about 1 to about 15 times greater than said thickness.

2. (original) A dynamic seal assembly according to Claim 1, wherein said length is from about 5 to about 15 times greater than said thickness.

3. (original) A dynamic seal assembly according to Claim 2, wherein said length is from about 5 to about 12 times greater than said thickness.

4 - 6. (cancelled)

7. (previously presented) A dynamic seal according to Claim 1, wherein the hardness of said annular seal is Shore A 50 or greater, the tensile strength of the seal is 4 MPa or greater, the modulus at 100% of the article is at least about 4 MPa, and the elongation at break of the article is 10% or greater.

8. (previously presented) A dynamic seal according to Claim 1, wherein said cured fluorocarbon elastomer is present at a level of at least about 35% by weight based on the total weight of said cured fluorocarbon elastomer and said thermoplastic polymer.

9. (original) A dynamic seal according to Claim 8, wherein said cured fluorocarbon elastomer is present at a level of at least about 50% by weight based on said total weight.

10. (previously presented) A dynamic seal according to Claim 1, wherein said thermoplastic material is a thermoplastic elastomeric material comprising an amorphous polymer having a glass transition temperature of at least about -40°C.

11. (previously presented) A dynamic seal according to Claim 1, wherein said thermoplastic material is a reactive oligomer material which comprises a semi-crystalline polymer having a melting point of at least about 80°C.

12. (previously presented) A dynamic seal according to Claim 1, wherein said fluorocarbon elastomer is selected from the group consisting of VDF/HFP, VDF/HFP/TFE, VDF/PFVE/TFE, TFE/Pr, TFE/Pr/VDF, TFE/Et/PFVE/VDF, TFE/Et:PFVE, TFE/PFVE; and mixtures thereof.

13. (withdrawn) A dynamic seal according to Claim 1, wherein said radial seal is made by a process comprising the steps of:

- (a) combining an uncured or partially cured fluorocarbon elastomer, a curative agent capable of reacting with the fluorocarbon elastomer to effect cure, and a thermoplastic material;
- (b) mixing the combination;
- (c) applying heat to the combination during the mixing step; and
- (d) forming the seal by subjecting the composition to one of blow molding, compressive molding, injection molding, or extrusion.

14. (withdrawn) A dynamic seal according to Claim 1 wherein the radial seal is made by a process comprising made by a process comprising the steps of:

- (a) mixing the elastomer and thermoplastic components in the presence of the curative agent;
- (b) heating during mixing to effect cure of the elastomeric components; and
- (c) injection molding the composition.

15. (original) A dynamic seal according to Claim 1, wherein said first member is a housing, and said second member is a rotating shaft.

16-17. (cancelled)

18. (currently amended) A dynamic seal assembly for installation between an inner rotating shaft and an outer housing comprising:

an annular radial seal extending from said non-rotating housing into sliding contact with said shaft, said annular radial seal being configured to slidably engage said shaft, said radial seal having a thickness, and a length which is from about 1 to about 15 times greater than said thickness, said annular radial seal further comprising a flat bearing surface which contacts the rotating shaft, wherein said annular seal comprises a vulcanized fluorocarbon elastomer dispersed in a thermoplastic matrix comprising a non-fluorine containing polymeric material, said annular seal yielding a ratio of loss modulus to storage modulus which is less than about 1.0.

19. (original) A dynamic seal assembly according to Claim 18, wherein said length is from about 5 to about 15 times greater than said thickness.

20. (original) A dynamic seal assembly according to Claim 19, wherein said length is from about 5 to about 12 times greater than said thickness.

21. (withdrawn) A dynamic seal according to Claim 18, wherein said flat bearing surface comprises a variegated surface.

22. (withdrawn) A dynamic seal according to Claim 21, wherein said variegated surface is a helical spiral groove.

23. (original) A dynamic seal according to Claim 18, wherein said annular seal comprises a reinforcing bead.

24. (withdrawn) A dynamic seal according to Claim 18, wherein said annular seal comprises a pair of suspension flanges and a spring disposed between the suspension flanges.

25. (cancelled)

26. (original) A dynamic seal according to Claim 18, wherein said annular seal is formed of a material having a ratio of loss modulus to storage modulus which is less than about 0.1.

27. (previously presented) A dynamic seal according to Claim 18, wherein said vulcanized fluorocarbon elastomer is present as a discrete phase or a phase co-continuous with said thermoplastic matrix.

28. (currently amended) A dynamic seal assembly for installation between an inner rotating shaft and an outer housing of an automotive application, the seal assembly comprising:

a ring for fixed engagement with the outer housing; and

an annular seal extending radially from said ring and having a reinforcing bead configured to slidably engage the inner rotating shaft and seal a bearing surface interface, said seal comprising a non-continuous phase vulcanized fluorocarbon elastomer dispersed in a continuous phase thermoplastic material matrix comprising a non-fluorine containing material polymeric material.

wherein said annular seal has a thickness, and a length that is from about 1 to about 15 times greater than said thickness,

further wherein a hardness of said annular seal is Shore A 50 or greater, a tensile strength of said annular seal is 4 MPa or greater, a modulus at 100% of said annular seal is at least about 4MPa, and an elongation at break of said annular seal is 10% or greater.

29. (previously presented) A dynamic seal assembly according to Claim 28, wherein said vulcanized fluorocarbon elastomer is present at a level of at least about 35% by weight based on a total weight of said vulcanized fluorocarbon elastomer and said thermoplastic matrix.

30. (previously presented) A dynamic seal assembly according to Claim 28, wherein said annular seal has a tangent-delta of less than about 1.0.

31. (new) A dynamic seal assembly according to Claim 28, wherein said annular seal is post cured by continued mixing of said elastomer and said thermoplastic during a cool-down period.

32. (new) A dynamic seal assembly according to Claim 1, wherein said annular seal is post cured by continued mixing of said elastomer and said thermoplastic during a cool-down period.
